

**Supplementary Figure.**  
**Combined Effects of Highly Palatable Food (HPF) and Neuropeptide Y (NPY) on Trunk Fat**

- The interaction of the standardized continuously assessed NPY and HPF scores in association with trunk fat at baseline was significant at  $p=.01$ , controlling for age, physical activity, NSAID and antidepressant use (as in previous final model analyses). For illustrative purposes only, the depicted scatterplot uses median split NPY.
